

Problem-1 : Create a HTML page that accepts order details:

| | | |
|--|---|---|
| Order ID : | <input type="text" value="1"/> | |
| Cust name : | <input type="text" value="Techi"/> | Cust name cannot be < 6 characters |
| Enter Billing date : | <input type="text" value="13-10-2017"/> | Billing date cannot be greater than shipping date |
| Enter Shipping date : | <input type="text" value="03-10-2017"/> | |
| Order total : | <input type="text" value="10000"/> | |
| <input type="button" value="display"/> | | |

Following are validations required:

- All fields are mandatory
- Cust name must be greater than 5 characters.
- Billing date must be lesser than shipping date

When user clicks on “display” button, the form must be submitted to the server – an Express JS app.

Extract all incoming form parameters and store into a text file with pipe (|) separated values. Eg, the text file should look like this:

Order.txt:

Ordered|customername|billingdate|shippingdate|otdertotal
101|Jayant Sinhal|2021-12-10|2021-13-10|5000
102|Mahima Sharma|2020-12-10|2020-17-10|7500

If file is written successfully, send a message back to browser – Order 101 successfully saved

Problem-2 : Create a web application to allow end user to perform the following operations on this table.

1. Develop Index page will have 2 hyperlinks specifying the operations as show below

Employee Info Systems

[Add New Employee Record](#)
[Retrieve Employees](#)

2. By clicking *Add new Employee Record* link user will be taken to new page where he can enter details about new employee and submit as shown below:

| | |
|------------------------------------|----------------------|
| Enter Employee Info | |
| Enter ID | <input type="text"/> |
| Enter Name | <input type="text"/> |
| Enter Salary | <input type="text"/> |
| Enter Department | <input type="text"/> |
| <input type="button" value="Add"/> | |

3. *Retrieve Employees* link will take user to employee List page as shown below.

| ID | NAME | SALARY | DEPARTMENT | |
|-------|---------|--------|--------------|------------------------|
| 12345 | Virat | 25000 | ProductionBU | delete |
| 12346 | Rahul | 35000 | Sales & Mktg | delete |
| 12347 | Kapil | 44000 | FSBU | delete |
| 12343 | Jasprit | 15000 | FSBU | delete |

The delete link should delete the employee in that row

Use either an Employee array to store Employee information or use MongoDB to do the same.

Problem-3 : Matrimony Application : Develop a web application for an online matrimonial system that allows user to register and search for bride and groom. A person who is looking for bride or groom can use this web application. User will have to first register himself. User can login and search for bride or groom by passing gender and age.

Below are the requirements for the application:

The system is a Web-based application. When any user accesses the website, following Home page (login) will appear.

Login:

| | |
|--------------------------------------|---------------------------------------|
| UserName: | <input type="text"/> |
| Password: | <input type="password"/> |
| <input type="button" value="Reset"/> | <input type="button" value="Submit"/> |
| New User click here | |

- a. If user is existing user, he can login by passing username and password. It will authenticate user at server side. If user is valid, welcome page will display.
- b. If username/password is invalid, take user back to Login screen with appropriate error message (username invalid or password is invalid)
- c. If user is new then user will click on "new user click here" link. Register.jsp page will display.

2. Register.jsp page:

| | |
|--|-------------------------------------|
| User Name : | <input type="text"/> |
| Password : | <input type="password"/> |
| Email : | <input type="text"/> |
| Gender : | <input type="button" value="Male"/> |
| Age : | <input type="text"/> |
| Address : | <input type="text"/> |
| Contact number : | <input type="text"/> |
| <input type="button" value="submit details"/> <input type="button" value="Reset"/> | |

- **While adding details, validate for the following:**

- ✓ All fields are mandatory.
- ✓ Password must be at least 6 characters
- ✓ Username should be unique
- ✓ Email should be valid
- ✓ Age and contact number can have only numbers

If all fields contain valid data, record will be inserted in user table and Welcome.jsp page will display.

3. Welcome.jsp page:

Welcome <username> to Matrimony

[View profile](#)
[Search for better half](#)

This page has different links for the user:

- View profile : Go to profile.jsp page for display user's profile
- Search for better half : Go to search.jsp page for searching

4. Profile.jsp page:

<username's> profile

| | |
|-----------|----------------|
| Name : | John |
| Gender : | M |
| Age : | 34 |
| Address : | Washington, US |
| Contact : | 23342334 |

5. Search.jsp page:

Search page

Gender:

Minimum Age :

Maximum Age :

Search page will allow user to search for better half.

6. Result.jsp page:

selected profile

| Name | Gender | Age | Address | Contact |
|--------|--------|-----|-------------------|------------|
| Mariya | F | 23 | M3,Panchganga, UK | 9585858596 |

Result page will search all the record from database those are satisfying condition passed by search page like gender and age.

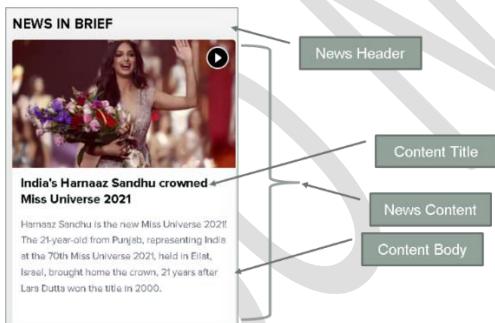

React Assignments:

1. Create 2 simple React components: About and ContactUs. About should simply display some information about your organization. ContactUs must display contact info like email, url and phone no.
2. Display both components as cards. Use CSS. Sample CSS given (you can use your own styling). Enhance this later with Bootstrap card classes instead of CSS

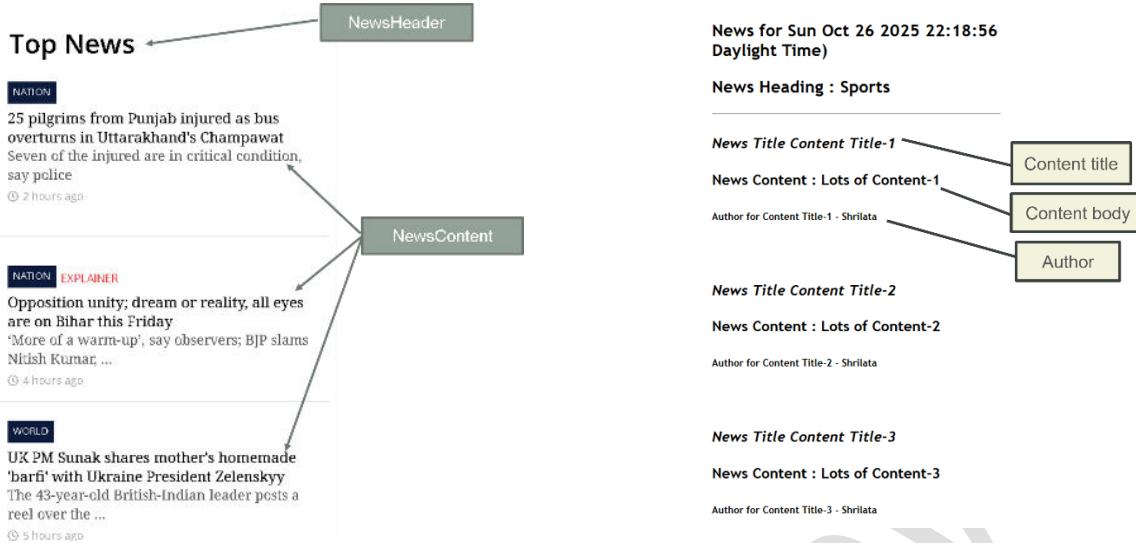

```
.card {  
  margin: 2rem auto;  
  padding: 2rem;  
  width: 40%;  
  flex-wrap: wrap;  
  border-radius: 6px;  
  background: linear-gradient(#f1bca5, #dd7d23);  
  box-shadow: 0 0 8px rgba(0, 0, 0, 0.3);  
}
```

3. Create a simple React application having 2 components:
 - NewsHeader : simply displays some header info. Eg Top News.
 - NewsContent just displays some content title and content body. Make NewsContent a child of NewsHeader.
Don't go for images anywhere
 - Add these components to App and display! A sample given below

4. Splitting components : Now create 3 NewsContent components under header (eg Top news), each NewsContent having with its own title, content body and author. For this, create 3 additional components – NewsTitle, NewsBody and Author and make them children of NewsContent. Pass the title, News content and author-name as props to NewsTitle, NewsBody and Author components.
Add these components to App and display! A sample given below

5. Create a simple array (list) of employees. Eg:

```
const emps = [
  {ename: "Anita", desig:"Manager", dept:"Trg", email:"Anita@abc.com"},
  {ename: "Kavita", desig:"SSE", dept:"FSBU", email:"Kavita@abc.com"},
  {ename: "Sunita", desig:"Associate", dept:"Legal", email:"Sunita@abc.com"},
]
```

Also create a component called “Employee” that will display details of employee

Loop thru the above list and for each iteration, call the Employee component and pass values. Display can look similar to this:

Hint : While looping thru, you can use spread operator to spread the employee object like this:

```
{emps.map(emp => (
  <Emp key={emp.ename} {...emp} />
))}
```

6. Enhancement: Create a state with a list in it. Use hardcoded values in state to set the values of the news-title and news-body. (once again, don't use images anywhere)

Apply card-style CSS/styles to all the elements (Header as well as content). You can display news horizontally or vertically. Egs given below.

LATEST NEWS

Trump demands China cough up \$10 trillion for causing Covid pandemic

Former US President Donald Trump is demanding that Beijing cough up \$10 trillion to the world for its role in causing the coronavirus pandemic amid growing scrutiny on how much infectious disease pundit Dr Anthony Fauci knew about work being done at the Wuhan Institute of Virology.

Covid wave will come back again if ...' Centre

Lav Agarwal, Union health ministry joint secretary, on Friday, said India has to buy time to ensure high coverage of vaccination against Covid-19. He pointed out that about 43 per cent of the population aged above 60 has been vaccinated, while 37 per cent of people above 45 years has been inoculated so far. India is currently recording a 66% decline in daily cases, he said.

Pfizer produces 5-times less antibodies against Delta variant'

People fully vaccinated with the Pfizer-BioNTech vaccine are likely to have more than five times lower levels of neutralising antibodies against the Delta variant first identified in India compared to the original strain, according to a study in *The Lancet*. It also shows that levels of these antibodies that are able to recognise and fight the virus are lower with increasing age.

India's Harnaaz Sandhu crowned Miss Universe 2021

Harnaaz Sandhu, the new Miss Universe 2021, the 25-year-old from Punjab, representing India at the 70th Miss Universe 2021, held in Israel, brought home the crown, 21 years after Leila Dattoo won the title in 2000.

Covid-19: India logs 7,350 new cases; active cases lowest in 561 days

With 7,350 fresh cases, having been reported in the last 24 hours, India's Covid-19 tally rose to 8,06,97,660. The number of active cases, as per the government, declined to 91,955, the lowest in 561 days. The death toll has climbed to 475,536 with 202 new fatalities. India's current recovery rate stands at 99.37%.

20 years of 2001 Parliament attack: President, PM, ministers pay tributes

On the 20th anniversary of the 2001 Parliament attack on Monday, President Ram Nath Kovind, Prime Minister Narendra Modi and several Union ministers paid tributes to the people who lost their lives in the incident. The terrorist attack had claimed 148 lives, while several others sustained injuries. All 148 victims were killed in the attack.

- Create a form that will accept new NewsContent. Accept Content-Title, Content-Body and author for each NewsContent. Adding this new NewsContent component should update the existing list of news articles

- You have an array of employee objects in JSON format. Put it into React App's state.

Create a **class based** component - **EmpDataComponent** that contains a list of these Employee objects. Create another class-based component – **EmpRow** which will receive this list from EmpDataComponent and will display emp data in a neat tabular fashion. Pass emp information from EmpDataComponent component into EmpRow component. Output should be something like :

| Employee Data | | | |
|---------------|---------|-------|--|
| 101 | Anita | 25000 | |
| 200 | Bharati | 30000 | |
| 100 | Uma | 43000 | |

- Create a React form. When user clicks on button, the full name from both text fields must be displayed (as shown)

| | |
|---------------------------------------|-------|
| FirstName : | Anil |
| LastName : | Patil |
| <input type="button" value="Submit"/> | |
| Anil Patil | |

- Create a single Component called ToDoComponent. This component provides a input field for user to enter his ToDo list. The list will be rendered below the field. Clicking on an item in the list should delete the ToDo item from the list. You can use Math.random() to generate id. Perform all actions within this single component and render component in App.js. Initial screen looks like:

TODO LIST

When items are added:

TODO LIST

Get Groceries

Buy Food for dog

Clicking on an item must delete the item:

TODO LIST

Get Groceries

Call Electrician

11. **Optional** : Create a React form as below. On entering a player name and clicking on “add player”, an array containing names should be updated with new player name.

Cricket Players

- Virat
- Yuvraj
- Dhoni

Player Name :

12. Create Weather App. I have an array of Weather Information with details like date, weather(sunny/cold/cloudy) and temperature. Loop thru the array. Fetch each weather information. Examine the weather and depending on weather, use a bootstrap icon. Display weather information as shown. Later read weather information from a REST API. The backend will be created by you using the backend technology you know.

NodeJS assignments:

1. Print the following (use nested loop):

```
1  
22  
333  
4444  
55555  
666666  
7777777  
88888888  
999999999
```

2. Write a function nameLength() that accepts an array of employee names. Find and display those employee names, which are more than 4 characters.

For example : ["Joy","Meena","Anne","Xi","Veena"]

The following should get displayed : Meena Veena

3. Write a function min() that takes a array and returns minimum number in the set of arguments.. Do not use the Math predefined object

Local Modules:

- 1) Create a user defined local module greet.js containing a function greet() that greets user based on time of the day. If its morning, greet user as "Good morning", if its afternoon, greet user as "Good Afternoon" else as "Good Evening"

Create a client module that will bring in the greet.js module and invoke the greet function

- 2) Create a user defined local module calc.js that exposes the following functions: add(a,b), subtract(a,b), multiply(a,b), divide(a,b), square(a), min(a,b,c), max(a,b,c)
 - Create a client application that invokes each of these methods
 - Make use of Math predefined core object. Create a client application that invokes each of these methods
- 3) Create 3 user defined modules that deal with shapes: circle.js, rectangle.js, triangle.js
 - Circle.js has functions like : calcArea(radius), calcCircumference(radius), calcDiameter(radius)
 - Rectangle.js – calcArea(length, breadth), calcPerimeter(length, breadth)
 - Triangle.js – isEquilateral(side1, side2, side3), calcPerimeter()

File handling:

- 4) Create an array of names. Read the contents of array and save into a file – names.txt as a string delimited with | (pipe)
eg var arr = ["aaa","bbb","ccc"] must be stored in file as aaa|bbb|ccc
- 5) File handling: Assume I have a file emp.txt that contains employee data in the following format:

```
1001:Harry :Sales :23000  
1002:Sarita :Accounts :20000  
1003:Monika:TechSupport:35000
```

Read the file. Display total sum of salary of all employees. In this example, it must display 78000

- 6) Consider an array that holds 4 employee objects. Emp details could be empid, empname and salary.
Loop thru this Employee array and store the employee objects in a text file using same format as follows:

```
1001:Harry :Sales :23000  
1002:Sarita :Accounts :20000  
1003:Monika:TechSupport:35000  
...
```

- 7) Assume a customer.json that has an array of customers with details like customer name, address, ph no, credit-rating etc for each customer. Read this file, parse the json and display all customer names along with their contact details

```
[  
  {  
    "custname": "Anil Patil",  
    "address": "abd 123",  
    "phno": "8877669988",  
    "rating": 8  
  },  
  {  
    "custname": "Anita Kulkarni",  
    "address": "A102, Highstreet",  
    "phno": "99675456",  
    "rating": 7  
  },  
  {  
    "custname": "Kavita Menon",  
    "address": "BB203, Pune",  
    "phno": "123456789",  
    "rating": 9  
  }  
]
```

- 8) Consider a json array object that describes an array of books with bookid, name, author and selling price. Loop thru array, calculate discount on each book and hence final price, convert each book json object into string in below format and save into a file book.txt
eg, assuming discount of 10% on all books:
Bookid|bookname|author|Sellingprice|finalprice
1001|Core Java|Cay Horstman|500|450

- 9) Create a simple text file. Now use node file handling to read each line from text file, prefix line with a number and display.

Sample text file:

Node is a JS runtime platform
Created with C++ and Javascript
Runs on the V8 engine
Created by Ryan Dhal

Output :

1. Node is a JS runtime platform
2. Created with C++ and Javascript
3. Runs on the V8 engine
4. Created by Ryan Dhal

Node HTTP and the web:

- 10) Write a browser based app. Everytime a http request comes in, server must send a greeting back to user depending on time of the day. Use the Greet.js module created earlier.

ExpressJS ass:

- 11) Create a html form that takes three strings and passes these parameters to ExpressJS application. This application must respond with HTML that displays all parameters in an unordered list:

The left screenshot shows a form with three input fields and a submit button. The right screenshot shows the resulting page with the submitted values displayed as an unordered list.

Left Screenshot (Form):

Enter first String :Seema
Enter second String :Sudhir
Enter third String :Dalvi
submit

Right Screenshot (Response):

The parameters are

- Seema
- Sudhir
- Dalvi

- 12) Develop a web application as follows:

- Design **simpleInt.html** to capture Principal Amount, No of years and rate of Interest
- A ExpressJS application will receive these numbers and will generate response with simple interest value to user

- 13) Develop a login app. The login.html must accept username and password and submit to node. At server side, create a Javascript array that contains username and password as comma separated values. Enter 3 user details.

```
let users = [
  {uname:"shrilata", pass:"secret"},
  {uname:"admin", pass:"admin123"},
  {uname:"user1", pass:"pass1"},
]
```

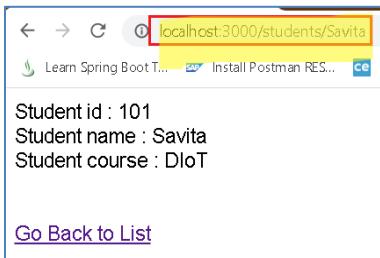

Middleware must check if username and password is available in a Javascript array. If yes, send success.html, else failure.html

- 14) Create a ExpressJS application with an HTML that accepts username and password. HTML has a submit button called "Signup". On submitting the form, store the username and password details as a json object into an array

- 15) Create a ExpressJS application. At server side create an array of students with studentid, student name, course.

```
let studs = [
  {sid:101, sname:"Savita", course:"DIoT"},
  {sid:102, sname:"Kavita", course:"DAC"},
  {sid:103, sname:"Anita", course:"DESD"},
  {sid:104, sname:"Sunita", course:"DJoT"},
  {sid:105, sname:"Babita", course:"DMC"},
]
```

Use Restful URL to search on name (eg URL highlighted in below screenshot). On receiving name, search thru array and to find the correct student and return student details as shown below.

- 16) In the previous App, create another path (localhost:3000/students) to fetch all students. This will be my Rest endpoint.
- Create an ajax application that will connect to this endpoint, fetch all students details and display in HTML as a neat HTML table
 - Create another ajax application that has an HTML to accept student name. Concatenate this name to a get request URL and fetch and display that student details in browser

Next gen Javascript ass:

- Write a function transformToObjects() that transforms a list of numbers into a list of JavaScript objects. For the provided input [1, 2, 3] the transformToObjects() function should return [{val: 1}, {val: 2}, {val: 3}].

```
function transformToObjects(numberArray) {
    // Todo: Add your logic
    // should return an array of objects
}
```

- Consider an array of products objects. For each product, we store productid, productname, price and category. Eg productArr = [{pid:1001, prodName:"Gaming headset",3000,"Headset"},....] Using Javascript forEach, loop thru the product array and display contents in neat HTML table
- Consider the product array in last example. Iterate thru the array, filter out all products that have the category "toys" and put in a new array ToyArray. Display the array. Use Javascript's array.filter() for this

Lab Assignments:

HTML:

Problem statement-1 : Create your resume page as per the format shown in the figure.

| <u>Resume</u> | | | | | | | | | | | | | | | | | | | | | | | | |
|---|-----------------|-------------------|----------|-----------------|-------------------|-----------------|------------------|----------|-----------------|---------|-------|-------------------|-----|------|-----|-----------|------|-----|------|-----|-----------|------|-----|------|
| <i>Abc Pqr</i> Unit 55, SDF II, SEEPZ, Andheri(E), Mumbai-400 096. Mobile No: 9898989898 Email: abc@patni.com | | | | | | | | | | | | | | | | | | | | | | | | |
| Educational Qualifications: | | | | | | | | | | | | | | | | | | | | | | | | |

| DBMS: | Oracle 9i | | | | | | | | | | | | | | | | | | | | | | | |

Problem statement-2 : Create a web page to display a list as shown in the figure:

Nested List

- I. Background Skills
 - A. Unix Commands
 - B. Vim Text Editors
- II. HTML
 - A. Minimal Page
 - B. Headings
 - C. Elements
 - D. Lists
 - i. Unordered
 - ii. Ordered
 - iii. Definition
 - iv. Nested
 - E. Links
 - i. Absolute
 - ii. Relative
 - F. Images
- III. CSS
 - A. Anatomy
 - B. Basic Selectors
 - i. Element
 - ii. Class
 - iii. ID
 - iv. Group
 - C. The DOM
 - D. Advanced Selectors

Problem statement-3.a : Create a web page to display tables as shown in the figures below.

| User Name | Education | Location |
|-----------------|-----------|----------|
| Praveen Kumar | B Tech | Guntur |
| Mahendra Dasari | CA | Chennai |
| Nagaraju Dasari | MCA | USA |
| Sateesh Alavala | MD | Vizag |
| Sudheer | B.Tech | Kakinada |

3.b

| STATE | |
|--------------|------------------|
| East | Orissa |
| | Bihar |
| | West Bengal |
| | Mizoram |
| West | Maharashtra |
| | Gujrat |
| | Karnataka |
| South | Andhra Pradesh |
| | Tamil Nadu |
| | Kerala |
| North | Jammu & Kashmir |
| | Himachal Pradesh |
| | Punjab |
| | Uttar Pradesh |

3.c

| Flight Schedule | | | | |
|-----------------|----------|-----------|------------|----------|
| Flight Number: | From: | To: | Departure: | Arrival: |
| BA 3451 | Heathrow | Nuremberg | 19:20 | 19:50 |
| BA 1254 | Luton | Alicante | 19:40 | 20:50 |
| LH 331 | Heathrow | Hamburg | 20:00 | 20:20 |

Total: 3 flights

3.d: Create a web page to display tables as shown in the figures below. Clicking on link should lead the user to another document that displays a brief description of the book and review comments.

List of Java Books

| Book Title | Author | Book Price |
|----------------|-----------------|------------|
| Core Java | Cay Horstman | 400 |
| Beginning Java | Ivar Horton | 600 |
| Learning Java | Kishori Shahane | 400 |
| Java Cookbook | John Keller | 800 |

Problem statement-4 : Create a Web page on any particular topic. Be sure to bring images in like the sample web page below.

Stratovolcanoes

Strato Volcanoes comprise the largest percentage (~60%) of the Earth's individual volcanoes and most are characterized by eruptions of [andesite](#) and [dacite](#) - lavas that are cooler and more viscous than [basalt](#). These more viscous lavas allow gas pressures to build up to high levels (they are effective "plugs" in the plumbing), therefore these volcanoes often suffer explosive eruptions.

Strato volcanoes are usually about half-half lava and [pyroclastic](#) material, and the layering of these products gives them the other common name of composite volcanoes.

Left: This is a schematic diagram of a strato volcano, intended to illustrate the different layers of different materials that comprise them. The purple colors are meant to represent [ash](#) layers, either the products of fall-out from big eruption clouds or the products of pyroclastic flows. Notice that these ash layers tend to be thin but widespread. Orange colors represent the flows of lava that issue from the volcano. Red colors represent the magma chambers beneath the volcano. The green colors represent lava domes, and notice that they do not flow very far. Each eruption, regardless of what it produces, is fed from the [magma chamber](#) by a [dike](#). Most dikes come up through the center of the volcano and therefore most eruptions occur from a or near the summit. However, some dikes head off sideways to feed eruptions on the flanks.

Right: This is a pit that has been dug into the ground at Cotopaxi, a big strato volcano near Quito, the capital city of Ecuador. The pit is about 2 meters deep and in it you can clearly see a number of ash layers exposed. It is also easy to see that the layers are different - some are coarse and others are fine, some are dark-colored and others are light-colored.

The lava at strato volcanoes occasionally forms [dikes](#), but more commonly it barely flows at all, preferring to pile up in the vent to form volcanic domes. Some strato volcanoes are just a collection of domes piled up on each other. Strato volcanoes are commonly found along subduction-related volcanic arcs, and the [magma supply rates](#) to strato volcanoes are lower. This is the cause of the cooler and differentiated magma compositions and the reason for the usually longer [eruptive](#) periods between eruptions. Examples of strato volcanoes include Mt. St. Helens, Mt. Rainier, Pinatubo, Mt. Fuji, Merapi, Galeras, Cotopaxi, and super plenty others.

Problem statement-5: Create the two web pages to display as shown in the figures below

| Name | Value |
|---|---|
| Name | <input type="text"/> |
| Sex | <input checked="" type="radio"/> Male <input type="radio"/> Female |
| Eye color | <input type="text" value="green"/> |
| Check all that apply | <input type="checkbox"/> Over 6 feet tall <input type="checkbox"/> Over 200 pounds |
| Describe your athletic ability: | <input type="text"/> |
| <input type="button" value="Enter my information"/> | |

5-a:

| | |
|--|--|
| Username: | <input type="text"/> |
| Password: | <input type="password"/> |
| City of Employment: | <input type="text"/> |
| Web server: | — Choose a server — <input type="button" value="▼"/> |
| Please specify your role: <input type="radio"/> Admin <input type="radio"/> Engineer <input type="radio"/> Manager <input type="radio"/> Guest | |
| Single Sign-on to the following: <input type="checkbox"/> Mail <input type="checkbox"/> Payroll <input type="checkbox"/> Self-service | |
| <input type="button" value="Login"/> <input type="button" value="Reset"/> | |

5-c :

HTML5 + CSS:

Problem statement-1: Create a HTML5 web page that looks like:

The screenshot shows a web page titled "Appointment Scheduler" in an Opera browser. The page is structured with two main sections: "Personal Information" and "Appointment Request".

- Personal Information:** Contains fields for Name (text input), Telephone number (text input), E-mail address (text input), and Date of birth (date input).
- Appointment Request:** Contains a dropdown menu for "What is the reason for your visit?", a slider for "Current pain level", a dropdown for "Preferred date", and a dropdown for "Preferred time".
- Bottom:** A "Submit" button.

Problem statement-2: Create a HTML5 web page that looks like: (make use of CSS too)

The screenshot shows a registration form titled "Registration Details". It includes fields for University, Institute, Branch (with a dropdown menu), Degree (with a dropdown menu and radio buttons for "Pursuing" and "Completed"), Average CPI (with a dropdown menu and a "Upto" field), Experience (with a dropdown menu and a "Years" field), and a "Your Website Or Blog" URL field. At the bottom, there are navigation buttons for "Step 2" and "Step 3".

Problem statement-3: For the registration form created in HTML 5-C, provide CSS, so that form now looks like this:

Register

Kindly fill in this form to register.

CSS assignments:

1. Set the background color of a page to lightblue.
2. Consider this sample data:

Sample Data :

```
<body>
<h1>abc</h1>
<p>This is para-1</p>
<div id="div1">
<h1>div-1</h1>
<p>This is para-2</p>
<h1>div-2</h1>
<p>This is para-3</p>
</div>
<h1>xyz</h1>
<p>This is para-4</p>
</body>
```

- Change background color of div to green

- Change text color of the second “h1” to red and background color to gold
- Align only paras within a div tag to right
- Show the last para in bold with font family as Calibri. Display the text in uppercase with a ~~strike-through effect~~

3. Given the following sample data:

```
<ul>
<li>Marketing</li>
<li>Sales</li>
<li>Technology</li>
<li>Customer Support</li>
</ul>
```

Use CSS to change the background color and draw the border around the `` element as shown

4. Consider a document with multiple paras.

- Indent 1st line of each para similar to below figure.
- Also justify the margins of all paragraphs.
- Provide a paragraph header and align it to center
- Set the background of document to the CSS logo

Cascading Style Sheets, fondly referred to as CSS, is a simple design language intended to simplify the process of making web pages presentable.

CSS handles the look and feel part of a web page. Using CSS, you can control the color of the text, the style of fonts, the spacing between paragraphs, how columns are sized and laid out, what background images or colors are used, layout designs, variations in display for different devices and screen sizes as well as a variety of other effects.

CSS is easy to learn and understand but it provides powerful control over the presentation of an HTML document. Most commonly, CSS is combined with the markup languages HTML or XHTML.

5. Redo the table in Problem statement-3.a of HTML. Use CSS to provide table border and font and background color for table heading

| User Name | Education | Location |
|-----------------|-----------|----------|
| Praveen Kumar | B.Tech | Guntur |
| Mahendra Dasari | CA | Chennai |
| Nagaraju Dasari | MCA | USA |
| Sateesh Alavala | MD | Vizag |
| Sudheer | B.Tech | Kakinada |

6. Write a HTML page that has a small text content. Highlight a small portion of the content in blue and underline using embedded/instyle CSS. Eg:

This is a piece of text with highlighted elements in it.

7. Consider the following table. Create 2 CSS classes and apply these classes to alternate rows of table to give zebra effect

| Employee Name | Department | Salary |
|-------------------|------------|----------|
| Jane Smith | Marketing | \$95,000 |
| John Smith | Technology | \$90,000 |
| Brian Adam | Sales | \$72,000 |
| Mary Jones | Support | \$60,000 |
| Michael Jefferson | Technology | \$85,000 |

Test It

8. Refer to problem statement-2 in HTML. Use CSS to highlight the first item in every list to green (lightgreen)
9. (optional):

Javascript Lab Assignments:

Day-1 : JS fundamentals

1. Accept an integer value and a message from user and print the message that many number of times.
2. Find the greatest of 3 nos, accept no from user using prompt()
3. Write a program to list all even numbers less than or equal to the number n. Take the value of n as input from user. Use while loop
4. Write a program that accepts two numbers and a operator like (+,-,* ,/) from user and performs the appropriate operation indicated by the operator. Use switch case
5. Write a program to print the multiplication table of a given number up to 10 multiples. Eg for number 2, output should be like

```
2 * 1 = 2
2 * 2 = 4
2 * 3 = 6
2 * 4 = 8
2 * 5 = 10
2 * 6 = 12
2 * 7 = 14
2 * 8 = 16
2 * 9 = 18
2 * 10 = 20
```

6. Write a program to find sum of digits of given five-digit number. 12345 = 15
7. Write a program **cmi.js** that has a function that accepts a distance in inches and prints the corresponding value in cms. Note that 1 inch = 2.54 cm. Test the js file in HTML.
8. Write a function pow(x,y) that calculates x^y . Do not use the Math predefined object
9. Write Javascript function to find the sum and average of all passed parameters. Pass 3 parameters to the function
10. Write a program to find the sum of squares of even numbers upto N (accept from user). Create a function to find sum
11. Create a web page to calculate the Compound Interest using the formula given below:

$$\text{Compound Interest} = \left[P * \left(1 + \frac{r}{100} \right)^n \right] - P$$

Where:

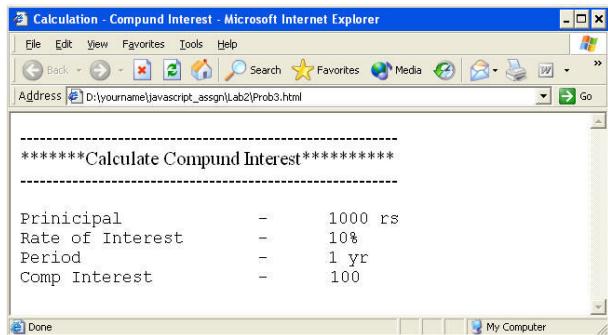

p = Principal,

r = Rate of Interest,

n = period in years

The values used in the example in the following figure are as follows:

P = 1000, n = 1, r = 10

JS objects

1. Create a web page that displays the current date in the format specified as in example below. Also as per current time, suitable greeting should be printed.
Today is Monday, 24 April 2000, Welcome, and Good Afternoon to You.
2. Write a function getWeekDay(date) to show the weekday in short format: 'MO', 'TU', 'WE', 'TH', 'FR', 'SA', 'SU'.
Eg : let date = new Date(2012, 0, 3); // 3 Jan 2012
alert(getWeekDay(date)); // should output "TU"
3. Accept and store names of 5 employees into array and display in sorted order of names
4. WAP to accept 10 words from the user into an array. Print all those words which are even in length and starts with A or a?
5. WAP to create a simple initialized int array with 5 integers. Iterate thru the array and find sum and average of all elements. Eg given array : var arr = [11,22,33,44,55]
6. WAP to create a simple initialized int array with 5 integers. Create a new empty array. Read the contents of initialised array and for every element, find square of the number and store into new array. Use appropriate array methods
7. WAP that has 10 numbers already stored in an array. Find the average of all numbers and then print how many numbers are above average.
8. We have an array that holds many web site names. Eg, www.google.com, www.msn.com, www.amazon.co.in, in.answers.yahoo.com, en.m.wikipedia.com, codehs.gitbooks.io, www.coderanch.com etc. Search for all sites that begin with "www" and display the total number of such sites. Eg for above eg, total is 4
9. Create an array that holds 4 employee objects and displays each emp detail in a table. Emp details is part of an custom Employee object and could be empid, empname and salary. Use for each loop to inspect all properties of each object

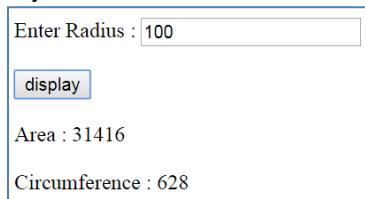

10. Create a custom object for rectangle and circle. Individual Rectangle objects should be able to store dimension, and have methods to print area and perimeter. Individual Circle objects should be able to store radius, and have methods to print area and circumference. Display dimensions, area and perimeter of rectangle and circle objects. Make use of Math pre-defined objects

11. Define a custom class Student with stud-name and course as properties and a function getDetails() which will print student details
 - Extend the Student class to create a GraduateStudent class which has an additional property "gpa"
 - Create objects of graduate student with name, course and gpa. Override the getDetails() methods from Student class to display gpa as well

12. Define a class Rectangle with its length and breadth.
 - Provide appropriate constructor(s), which sets rectangle object with values.
 - Provide methods to calculate area, calculate perimeter and to display all information of Rectangle (dimensions, area and perimeter).
 - Create 5 Rectangle objects by hardcoding all necessary information. Add the objects into an array. Iterate thru the array and for each rectangle object, calculate its area and display its information

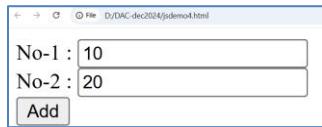

Day-3

1. Create a HTML form that accepts radius and displays the area and circumference of a circle. Make use of Math object

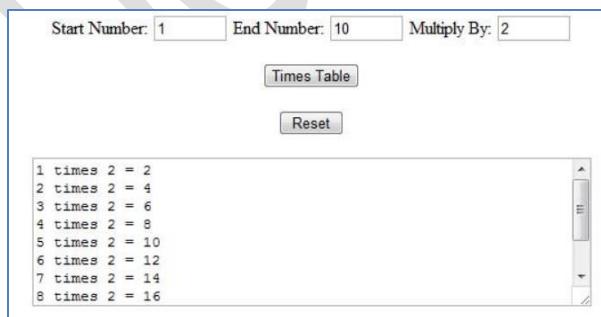

The screenshot shows a basic HTML form with a single input field labeled "Enter Radius :". Inside the field, the value "100" is entered. Below the input field is a blue "display" button. Underneath the button, the calculated "Area : 31416" and "Circumference : 628" are displayed.

2. Create a HTML form that accepts 2 numbers and displays sum of numbers at bottom of form

The screenshot shows a simple HTML form with two input fields labeled "No-1 : 10" and "No-2 : 20". Below these fields is a blue "Add" button. The result of the addition, "30", is displayed directly below the "Add" button.

3. Create a HTML form that accepts start and end values and displays multiplication table

The screenshot shows a more complex HTML form for generating a multiplication table. It includes three input fields: "Start Number: 1", "End Number: 10", and "Multiply By: 2". Below these is a blue "Times Table" button. Underneath the button is a blue "Reset" button. A scrollable text area displays the multiplication table for 2, ranging from "1 times 2 = 2" to "8 times 2 = 16".

4. Write a program that accepts (from the html form) a positive integer less than 1000 and prints out the sum of the digits of this number.

Enter a +ve no less than 1000: -4

Entered number is out of range

Enter a +ve no less than 1000: 1234

Entered number is out of range

Enter a +ve no less than 1000: 546
Sum of the digits of 546 is 15

5. Assume i have an array of member names. Read the array and display all member names as a string delimited by comma all in uppercase in the current document window
eg : var names = ['John','Steve','Ben','Damin','Ian']

Members of my Group are

JOHN,STEVE,BEN,DAMON,IAN

22. Assume we have this content in HTML <body>. An empty list and a button

```
<h3> Members of my Group are </h3>
<ol id="list">
</ol>
<input type="button" onclick="f1()" value="Populate list">
```

Members of my Group are

Populate list

Also assume I have a list of names. When I click on the button, script should read all names from array and populate the list with list items. Output must look like this:

Members of my Group are

- 1. Kavita
- 2. Anita
- 3. Sunita
- 4. Babita

Populate list

Use procedural DOM methods like createElement(), querySelector(), appendChild() etc for this assignment. Please refer to given PPT for examples on how to do this

6. Create a HTML page that will display the following form and on clicking the button, the details will be listed as shown. Also create an object with all details from form, show them below the form thru the newly created object. Email has to be valid. Lucky number must be in range 1 to 100

Enter Your Details

| | |
|--|--|
| Name: | Anita |
| Birth Date: | 11 - 11 - 2025 |
| Email Address: | anita@gmail.com |
| Gender: | <input type="radio"/> Male <input checked="" type="radio"/> Female |
| Lucky number (1-100): | 4 |
| Favorite Foods: | <input checked="" type="checkbox"/> Pizza <input type="checkbox"/> Pasta <input checked="" type="checkbox"/> Chinese |
| <input type="button" value="Send Data"/> | |
| You entered | |
| Name: Anita | |
| Birth Date: 2025-11-11 | |
| Email Address: anita@gmail.com | |
| Gender: Female | |
| Lucky Number: 4 | |
| Favorite Food: Pizza Chinese | |

7. Create a HTML table. Apply zebra stripes using javascript. Zebra stripes means that alternate rows are colored so that each row is clearly defined. Eg

| Student name | Course | Grade |
|---------------|--------|-------|
| Manisha Patel | DAC | B |
| Savita Rao | DITISS | B |
| Arnav Patil | DiT | A |
| Anita Kapoor | DAC | A |

8. Create a Java Script object that holds an array of at least 3 Java Script objects to store information about accounts:

account no - Numeric
account name - String
account balance - Numeric

Write a Java Script program to perform the following operations:

- A) Display the total balance
B) Loop thru array and display all account information in neat HTML table

Welcome to Javascript

| Acct ID | Acct Name | Acct Bal |
|---------|-----------|----------|
| 1001 | Soha | 90000 |
| 1002 | Shrilata | 80000 |
| 1003 | Sunil | 100000 |
| 1004 | Anita | 40000 |

9. Create a HTML page that will display the following Registration form and on clicking the button, the details will be listed as shown. Create an object with all details from form and add to an array. Display the contents of the array in a neat tabular manner at bottom of form

Registration form

Username :

Password :

Email :

| Username | Password | Email |
|----------|----------|-----------------|
| Shrilata | secret | shri@gmail.com |
| Anita | ani123 | anita@gmail.com |

10. Create an IPL ticket booking form to accept spectator details.

Spectator name :

Email Id :

Confirm Mail id :

Select stand :

Cost of Ticket :

- All text fields are mandatory
- EmailID and Confirm EmailId field values have to be same.
- Cost of ticket will be picked up, based on the stand selected. Use the table provided to select the cost. The field cannot be an editable field.
- Use the “book now” button to calculate ticket cost. If all the data is valid show an alert “All data entered correctly”
- Depending on Stand selected, cost of ticket would be:

| Stand | Floor | Charges (In Rs) |
|-------------------------|----------------|-----------------|
| Platinum Gallery | Not applicable | 25000 |
| Super Hospitality Stand | Not applicable | 20000 |
| North West Stand | First floor | 6000 |
| East Stand | First floor | 3000 |

- Make use HTML, HTML5, Javascript, CSS

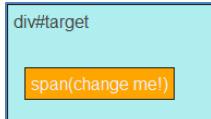

jQuery Lab Assignments:

- Find all h1 elements that are children of a div element and apply a background to them.

Sample Data :

```
<body>
<h1>abc</h1>
<div id="div1">
<h1>div-1</h1>
<h1>div-2</h1>
</div>
<h1>xyz</h1>
</body>
```

- Set the background color of a page to lightblue.
- Use the sample data in question1. Change background color of div to green
- Change the text in the span, a child of '#target'

- Change background color of the second 'div'.

- Hide all the input elements within a form. You may use one of the web page created in HTML lab
- Find the specific option tag text value of a given option. For eg, show the text value associated with second option (Should display Option-2)

Sample Data :

```
<body>
<select id="myselect">
<option value="1">Option-1</option>
<option value="2">Option-2</option>
<option value="3">Option-3</option>
</select>
</body>
```

- Write jQuery code to append a div element (and all of its contents) dynamically to the body element.
Insert the following code within HTML <body> tag : <div><h1>JQuery Core</h1></div>
- Write a jQuery Code to get a single element (li) from a list. Sample data: second list item is "Kiwi"

```
<body>
<ul>
<li>Apple</li>
<li>Kiwi</li>
<li>Strawberry</li>
</body>
```

- Given the above list, prepend each list item with a index number. Eg, display should be:

```
0:Apple  
1:Kiwi  
2:Strawberry
```

11. Assume a web page having 3 divs, one of them having a class applied. Find which div element has class applied. Sample data: (output would be div1)

```
<body>  
<div id="div1" class="divclass"></div>  
<div id="div2" ></div>  
<div id="div3" ></div>  
</body>
```

12. Assume we have this content in HTML <body>

```
<body>  
<h3> Members of my Group are </h3>  
<ol id="list">  
</ol>  
</body>
```

13. Also assume we have a array of person names (5 names).

Read from array and populate the above list with member names in bullet form.

Members of my Group are

- 1. John
- 2. Steve
- 3. Ben
- 4. Damon
- 5. Ian

14. Create a web page that accepts person name, age and whether employed (true/false) using HTML form elements.

On clicking “add” button, create a JSON obj with the person details. Add (push()) this json into an array. Provide another button “display” which will iterate thru array and display all persons details in a neat HTML table.

Bootstrap Lab Assignments

1. Create a dynamic layout containing blog posts. It must have a header that spans across the width of the whole website.

Then we have a three-column layout containing blog posts, when viewed on a desktop. In a tablet, the posts are contained in a two-column layout instead of three. The same website when viewed on mobile devices must display all posts in a single column.

My First Bootstrap Blog

Hear any good news lately?

Sometimes I think about what might be considered "random" things. This is what popped up in my head today as I was soaking up the joy of the Christmas season, and watching my kids get totally revved up about it. What do you think would happen if every major news...

The Big List of Fun Things to Do By Yourself

The Beauty of Being Alone This is a list of fun things you can do by yourself (or with friends in some cases). I've included TONS of links to some GREAT sites that can help get you moving and keep you entertained, so please feel free to share this post...

6 Classics - The Best Short Stories for Teenagers

It can be tough getting kids to read nowadays. There are so many cool electronic distractions and diversions for them to play with, that the idea of sitting down with a good book can seem sort of boring. You might not be able to convince your teenager to grab a...

24 Simple Workplace Etiquette Tips to Improve Your Life

Why Do Manners Matter? This sounds like a question you would ask in a kindergarten class, but there are plenty of grown ups who don't understand that having good manners and being polite actually helps daily routines to run more smoothly. Treating people and property with respect takes just a....

5 Free Tips for Managers from an Employee

I'm going to admit right up front that I have absolutely no desire to be in any kind of management or administrative position where I'd have to deal with a large number of employees. I give the people who take on that kind of role all kinds of credit. I

Finding Your Purpose in Life

Why I'm Cutting My Dog's Hair I recently gave myself a crash course in goldendoodle grooming. I had nothing against the groomer we were using. It was purely a money saving move. Ways to Get Rid of Mice in...

6 Classics - The Best Short Stories for Teenagers

It can be tough getting kids to read nowadays. There are

2. Create a simple vertical form in bootstrap:

Name

Email

Phone

Description

3. Create a simple form in Bootstrap as shown:

The image shows a registration form with the following fields:

- First Name**: Input field with placeholder "First Name".
- Last Name**: Input field with placeholder "Last Name".
- Department / Office**: Input field with placeholder "Select your Department/Office".
- Username**: Input field with placeholder "Username".
- Password**: Input field with placeholder "Password".
- Confirm Password**: Input field with placeholder "Confirm Password".
- E-Mail**: Input field with placeholder "E-Mail Address".
- Contact No.**: Input field with placeholder "(639)".

At the bottom is a large orange **SUBMIT** button.

4. Create the following webpage using navbar, jumbotron, buttons, glyphicons, grids etc

The landing page has the following structure:

- Header:** Balance Web Development, About, Services, Contact.
- Title:** Ready. Set. Code.
- Text:** Are you ready to bootstrap your cross-compatible buzzword? We're Sassy, flat and semantic, so what are you waiting for?
- Buttons:** Download Free Trial, Learn more.
- Grid Layout:**
 - Cloud Computable**: Donec id elit non mi porta gravida at eget metus. Fusce dapibus, tellus ac cursus commodo, tortor mauris condimentum nibh.
 - Backwards Compatible**: Etiam porta sem malesuada magna mollis euismod. Donec sed odio dui. Lorem ipsum dolor.
 - GUI Free**: Vestibulum id ligula porta felis euismod semper. Fusce dapibus, tellus ac cursus commodo, tortor mauris condimentum nibh.

5. Create a layout like given:

The application interface includes:

- Header:** Adam's To Do List
- Form Fields:**
 - Task: Input field.
 - Description: Input field with placeholder "Buy Flowers".
 - Done: Checkbox labeled "No".
 - Location: Input field.
 - Done: Checkbox labeled "No".
 - Done: Checkbox labeled "Yes".
 - Done: Checkbox labeled "No".
- Buttons:** Add (blue button).
